Source Test Procedure ST-5

CARBON DIOXIDE, CONTINUOUS SAMPLING

REF: Regulation 6-310.1

1. APPLICABILITY

1.1 This method is used to quantify emissions of carbon dioxide. It determines compliance with Regulation 6-310.1.

2. PRINCIPLE

2.1 A continuous representative gas sample is extracted from the sampling point and conditioned to remove water and particulate material. The carbon dioxide concentration is determined by passing a small portion of the sample through a non-dispersive infrared analyzer (NDIR) tuned to a frequency at which carbon dioxide absorbs infrared radiation.

3. RANGE AND SENSITIVITY

- 3.1 The minimum and maximum measurable concentrations of CO ₂ depend on the sample cell length in the analyzer.
- 3.2 The minimum sensitivity of the NDIR analyzer shall be \pm 2% of full scale.

4. INTERFERENCES

4.1 Possible interferences include methanol, ethanol and water.

5. APPARATUS

- 5.1 Carbon dioxide analyzer.
- 5.2 Chart Recorder. The recorder monitors and records the continuous output from the analyzer.
- 5.3 Sample conditioning, zero air, and span gas system. The assembly of this system is shown in Figure 5-1. The sample conditioning system provides a dry, particulate free gas flow to the instrument. The zero air system provides clean dry atmospheric air for instrument calibration. The span gas system provides a known concentration of CO₂ for use in calibrating the analyzer. Except as specified, all materials which come in contact with either the sample or span gases must be constructed of Teflon or stainless steel.
- 5.4 Sample Probe. Use a borosilicate glass tube of sufficient length to traverse the stack being tested. If the stack temperature exceeds 425 °C (800 °F), use a quartz probe. Other probes are acceptable subject to approval by the Source Test Section.
- 5.5 Condensers. Use modified Greenberg-Smith impingers with the impaction plates removed and the inlet tube shortened to a length of 10 cm (4 inches), or equivalent.
- 5.6 Cooling System. Immerse the impingers in an ice bath during the test.

- 5.7 Particulate Filter. Use a Balston type 95 holder with a grade B filter, or equivalent, in the sample system.
- 5.8 Pumps. Use leak-free, Teflon-lined, diaphragm pumps in the sample and zero air systems. The pumps must have a capacity of at least 28 liters/min (1.0 CFM).
- 5.9 Back-pressure Regulator. Use a back-pressure regulator to maintain the sample and zero gas sample pressures to the instrument at five psig.
- 5.10 Gas Scrubber. Use a bed of silica gel, Ascarite (or soda-lime), and charcoal to remove moisture, carbon dioxide, and hydrocarbons form the zero air system.
- 5.11 Span Gas. Use a high-pressure cylinder containing a known concentration of CO₂ in air or nitrogen. The span gas concentration must be in the same range as the source being tested.

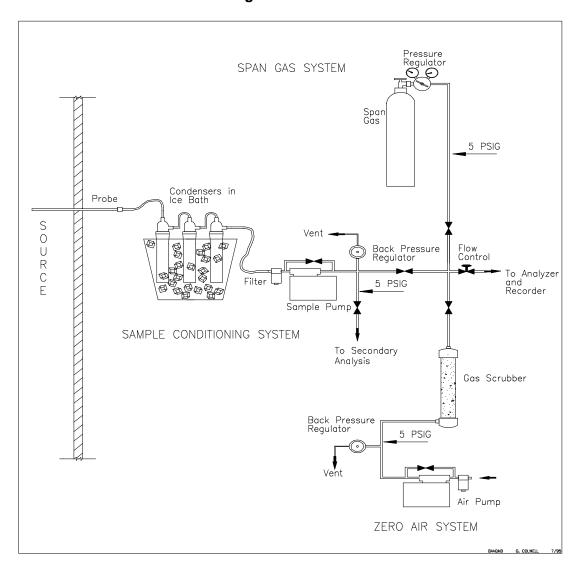

Figure 5-1

6. PRE-TEST PROCEDURES

- 6.1 Warm-up the instrument according to manufacturer's instructions.
- 6.2 Assemble the sampling system as shown in Figure 5-1.
- 6.3 Leak-test the sampling system by starting the pump, plugging the probe,and determining that the pressure to the analyzer falls to zero. Other leak-tests are acceptable subject to the approval of the Source Test Section.
- 6.4 Introduce zero air, into the analyzer and zero the instrument according to manufacturer's instructions.
- 6.5 Introduce span gas into the analyzer and calibrate the instrument according to manufacturer's instructions.
- 6.6 Conduct a preliminary concentration traverse (according to ST-18) to determine if stratification of the stack gases exists. If the CO ₂ concentration at any point differs from the average concentration by more than 10%, traverse the stack during the test. If not, sample at any single point.
- 6.7 Set-up the chart recorder according to manufacturer's instructions.

7. SAMPLING

- 7.1 Each test run shall be simultaneous with the particulate sampling when determining compliance with Section 6-301.1. Otherwise each test run shall be of 30 minutes duration or 90 percent of the batch time at a batch operation process, whichever is less.
- 7.2 Introduce sample gas into the analyzer at the same flow rate used to calibrate the analyzer.
- 7.3 Maintain ice in the cooling system throughout the test.
- 7.4 Calibrate the analyzer before and after each test run. Record each step of the process clearly on the chart recording.
- 7.5 Conduct three test runs.

8. CALCULATIONS

8.1 From the chart recording determine the time-averaged concentration of CO ₂ on a dry basis for each run.

9. REPORTING

9.1 These values are determined as auxiliary data for other procedures and shall be reported with those test results.
