Today I attended a meeting, questions were asked concerning global warming and the effects on the Bay area water rising. Since the Bay area's waters are indeed rising, what are the mitigation measures considered for the power plant? At some point, there will have to be some buffering mechanism in place to attempt to preserve development adjacent to the wetlands. Consistent criteria needs to be in place for all cities and counties to follow, but as of right now these concerns are in the discussion phase.

However, the question needs to be asked; who will pay for dykes, dredging or whatever kind of mitigation, that will be needed to preserve development adjacent to the wetlands. Since the proposed power plant is located in a flood plain and will be under water eventually in the future, who will be responsible and pay for the mitigation measures in order to keep the proposed power plant from being submerged under water?

Thank you for answering my question.
