Dear Mr. Weyman

Hello my name is Hardik Desai from San Lorenzo high school in San Leandro. This letter is about the opposing Fossil Fuel Power Plant because it will emit 12.2 tons of Sulfur Dioxide per year. This is one of the causes for concern over the environmental impact of the use of these fuels as power sources. It will also emit 1,926,339 metric tons of Carbon Dioxide. This is really bad because this is the main cause of the GLOBAL WARMING. And we need to stop Global Warming as fast as we can. Also 389.3 tons of Carbon Monoxide. Carbon Monoxide might be odorless and colorless, but it's an extremely toxic gas. Carbon monoxide can also have severe effects on the fetus of a pregnant woman. The Plant is also going to emit 121,000 lb of Ammonia per year. Although in wide use, ammonia is both caustic and hazardous. Under normal circumstances it is a very toxic gas. The main reason is that we don't get and power from the plant. We only get all the acids that are very dangerous and harmful to children. That's why I think we shouldn't build this plant instead we should we build a eco friendly plant like solar power plant.

Sincerely, Hardik Desai
