

**SYNTHETIC MINOR OPERATING PERMIT
EVALUATION REPORT
NASA-AMES RESEARCH CENTER
PLANT NUMBER A0550
APPLICATION NUMBER 23438**

BACKGROUND

The NASA Ames Research Center (NASA Ames) is subject to the requirements of Title V of the federal Clean Air Act, Part 70 of Volume 40 of the Code of Federal Regulations (CFR), and BAAQMD Regulation 2, Rule 6, Major Facility Review because it is a major facility as defined by BAAQMD Regulation 2-6-212. NASA Ames is a major facility because it has the “potential to emit” more than 100,000 tons per year of greenhouse gases (GHG) and 100 tons per year of a regulated air pollutant. Major facilities that are willing to accept federally enforceable permit conditions that limit emissions to less than Title V thresholds can apply for a Synthetic Minor Operating Permit. Based on 2010 usage data, it is estimated that actual emissions at NASA Ames are well below major facility thresholds. Therefore, NASA Ames has elected to apply for a Synthetic Minor permit.

This permit will establish federally enforceable permit conditions to limit the facility to a maximum of 90,000 tons/yr of GHG and 95 tons/yr of regulated air pollutants. Synthetic Minor permits must have practically enforceable limits and conditions that ensure that emissions never exceed major facility thresholds. The permit may also contain limits and conditions that have been established pursuant to other BAAQMD rules and regulations but do not contribute to the synthetic minor limits.

SITE DESCRIPTION

NASA Ames occupies a combined area of 1,864 acres at the former Moffett Field Naval Air Station. Their infrastructure consists of office buildings, laboratories, fabrication shops, wind tunnels, utility facilities, and other ancillary structures such as aircraft hangers and maintenance facilities. The infrastructure supports research in the aeronautics, physical sciences, space exploration, earth systems, and life sciences. NASA has identified a total of 279 air emission sources throughout the facility. Of these, 95 sources currently have permits from the BAAQMD.

POTENTIAL TO EMIT

NASA Ames has completed an emissions inventory of all sources of air pollutants throughout their facilities. The inventory was separated into three categories: (1) combustion sources, (2) evaporative loss sources, and (3) miscellaneous sources.

In terms of potential to emit (PTE) the combustion source category is by far the largest of the three. Using EPA guidelines and EPA and BAAQMD emission factors and permit limits, NASA has estimated the PTE for combustion sources at the facility. These estimates are summarized below in Table 1.

SMOP EVALUATION REPORT: NASA-AMES RESEARCH CENTER, PLANT #A0550,
Application 23438

Table 1: Potential to Emit – Combustion Sources

Source Type	Pollutant (tons/yr)					
	NOx	CO	PM	SOx	TOC	CO2e
Permitted Boilers/Heaters	49	5	0.43	17	21	147,251
Boilers/Heaters 2-10 MMBTU	48	40	4	0	5	57,535
Boilers/Heaters < 2 MMBTU	17	11	1	0	2	20,964
	114	56	5	17	28	225,750
Permitted Generators	75	147	3	1	6	6,200
Unpermitted Generators	6	58	0	0	2	58,448
	81	205	3	1	8	64,648
Total Combustion	195	261	8	18	36	290,398

Evaporative loss and miscellaneous sources make up the remainder of air emissions from the facility. All of these sources currently have BAAQMD permits. Potential emissions from these two categories are summarized below in Table 2.

Table 2: Potential to Emit – Evaporative Loss and Miscellaneous Sources

Source Type	Pollutant (tons/yr)					
	NOx	CO	PM	SOx	TOC	CO2e
Evaporative Loss Sources	0	0	0	0	18	0
Miscellaneous Sources	5.2	0	0.1	0	0.01	0
Total	5.2	0	0.1	0	18	0

Table 3 below, summarizes the total facility PTE in comparison to the Title V Major Source thresholds for each pollutant.

Table 3: Potential to Emit – Facility Wide

PTE Totals	Pollutant (tons/yr)					
	NOx	CO	PM	SOx	TOC	CO2e
Combustion	195	261	8	18	36	290,398
Evaporative Loss	0	0	0	0	18	0
Miscellaneous	5.2	0	0.1	0	0.01	0
Facility PTE	200	261	8	18	54	290,398
Major Source Thresholds	100	100	100	100	100	100,000

As demonstrated above, NASA Ames has a PTE for NOx, CO, and Greenhouse Gases as CO2 equivalent (CO2e) that exceeds the Major Source thresholds. However, the estimated actual emissions are significantly below both PTE and the Major Source thresholds. Therefore, NASA Ames is applying for a Synthetic Minor Operating Permit (SMOP).

Table 4 below, summarizes the actual emissions from the facility based on 2010 usage data.

SMOP EVALUATION REPORT: NASA-AMES RESEARCH CENTER, PLANT #A0550,
Application 23438

Table 4: Estimated 2010 Actual Emissions – Facility Wide

PTE Totals	Pollutant (tons/yr)					
	NOx	CO	PM	SOx	TOC	CO2e
Combustion	17.7	14.6	1.2	0.2	1.7	24,096
Evaporative Loss	0	0	0	0	0.7	0
Miscellaneous	0.01	0	0.1	0	0.01	0
2010 Actual Emissions	17.7	14.6	1.3	0.2	2.4	24,096
Major Source Thresholds	100	100	100	100	100	100,000

SYNTHETIC MINOR OPERATING PERMIT

In order to be eligible for a synthetic minor permit, a site must either have a maximum potential to emit that is less than each Title V emission threshold (less than 95 tons/year of NO_x, CO, POC, PM₁₀, and SO₂, less than 9 tons/year of any single hazardous air pollutant (HAP), and less than 23 tons/year of all HAPs combined) or must accept conditions limiting the site to less than these emissions thresholds (Regulation 2-6-423). In addition, EPA has recently adopted Title V permitting thresholds for greenhouse gas (GHG) emissions that became effective for all sites on July 1, 2011. Any site that has the potential to emit more than 100,000 tons/year of greenhouse gases (expressed as CO₂ equivalent) will be deemed a major facility and required to obtain a Title V permit. To be eligible for a Synthetic Minor Operating Permit for greenhouse gas emissions, the emission threshold is 90% of the Title V emission threshold, or 90,000 tons/year of CO₂ equivalent emissions, or must accept conditions limiting the site to less than these emissions thresholds (Regulation 2-6-423.2.2).

NASA Ames has proposed the addition of federally enforceable throughput limitations such that NOx and CO emissions will each be less than 95 tons/yr and CO2e emissions will be less than 90,000 tons/yr. Compliance with these limits will be demonstrated on a rolling monthly basis through the use of an emission calculation procedure that applies a throughput to an established emission factor to each source or source group.

DETERMINATION OF EMISSIONS

NASA has created emission calculation spreadsheets for the following source categories: (1) External Combustion Sources, (2) Internal Combustion Sources, (3) Evaporative Loss Sources, and (4) Miscellaneous Sources. These tables were submitted with the SMOP application and are the basis of the potential to emit determination for the facility as well as the means of demonstrating on-going compliance with the SMOP emission limits. A discussion of the emissions estimation methodology for each category follows.

External Combustion Sources

External combustion sources include all permitted and unpermitted boilers and heaters and a small incinerator. All sources are fired by natural gas. The emissions from permitted sources are based on emissions factors in the BAAQMD databank; factors for non-permitted external

**SMOP EVALUATION REPORT: NASA-AMES RESEARCH CENTER, PLANT #A0550,
Application 23438**

combustion equipment were all taken from the appropriate section of EPA AP-42 (Ref. SMOP Application, Table B-1). CO₂e emissions are based on the following formula: [(CO₂) + (CH₄ x 21) + (N₂O x 310)]

NASA will use actual natural gas consumption data to determine emissions on a monthly basis. Separately metered sources will have emissions based on individual emission factors and actual fuel consumption; the combined emissions from all other sources will then be calculated based on the remainder of facility wide natural gas use and the highest applicable emission factors.

Internal Combustion Sources

This category includes all internal combustion equipment (piston engines and turbines) fired by any fuel. Emission factors from permitted sources are from the BAAQMD databank; factors for non-permitted equipment were taken from the manufacturer or when not available from the appropriate section of EPA AP-42 (Ref. SMOP Application, Table B-4). CO₂e emissions are based on the following formula: [(CO₂) + (CH₄ x 21) + (N₂O x 310)]

NASA records fuel consumption for all Internal Combustion Sources. Fuel use will be combined with emission factors to determine monthly emissions.

Evaporative Loss Sources

Evaporative loss sources include a number of miscellaneous solvent use and coating operations. The emissions from this category are composed entirely of VOC and are readily quantifiable through solvent use records. Table B-7 of the SMOP application summarizes the sources and emission factors for this category.

Because the PTE for POC (TOC) is well below the Title V threshold, no additional requirements for this category will be added to the SMOP.

Miscellaneous Sources

Miscellaneous sources are those that do not fit into any of the other three categories. They include Research Operations a, small Tub Grinder, and an Ethylene Oxide Sterilizer. Table B-9 of the SMOP application summarizes the sources and emission factors for this category.

Four permitted research operations known as the “Arc-Jet Facilities” are NO_x sources and are subject to the facility-wide SMOP NO_x limit. These sources have existing NO_x limits under Permit Condition #10712. The other two sources in the “miscellaneous” category emit only PM and POC and are therefore not subject to SMOP limits. No additional requirements for this category will be added to the SMOP.

SYNTHETIC MINOR OPERATING PERMIT CONDITIONS

Synthetic Minor Operating Permit Conditions will be added as follows to ensure that the facility will continue to meet the requirements set out in 40 CFR Part 60.752(d) to avoid designation as a Title V facility.

SMOP EVALUATION REPORT: NASA-AMES RESEARCH CENTER, PLANT #A0550,
Application 23438

SYNTHETIC MINOR OPERATING PERMIT

NASA-Ames Research Center
Moffett Field, CA 94035
Application #23438
Plant #550

This facility, Site # A550, has a synthetic minor operating permit. This operating permit covers all sources of regulated air pollutants existing at this facility as of permit issuance.

The following conditions establish the federally enforceable permit terms that ensure this plant is classified as a Synthetic Minor Facility under District Regulation 2, Rule 6, Major Facility Review, and ensure it is not subject to the permitting requirements of Title V of the Federal Clean Air Act as amended in 1990 and 40 CFR Part 70. All applications submitted by the applicant and all modifications to the plant's equipment after issuance of the synthetic minor permit must be evaluated to ensure that the facility will not exceed the synthetic minor general limits below, and that sufficient monitoring, recordkeeping, and reporting requirements are imposed to ensure enforceability of the limits.

Any revision to a condition establishing this plant's status as a Synthetic Minor Facility or any new permit term that would limit emissions of a new or modified source for the purpose of maintaining the facility as a synthetic minor must undergo the procedures specified by Rule 2-6, section 423. The basis for the synthetic minor conditions is an emission limit of 95 tons per year for regulated air pollutants, of 90,000 tons per year for greenhouse gases (on a CO₂ equivalent basis), an emission limit for a single hazardous air pollutant of 9 tons per year, and an emission limit for a combination of hazardous air pollutants of 23 tons per year.

1. In no event shall the emissions from this site exceed any of the emission limits listed below. (Basis: Regulation 2-6-423)

NOx	95 tons/year
CO	95 tons/year
POC	95 tons/year
PM10	95 tons/year
SO2	95 tons/year
Any Single HAP	9 tons/year
Combination of HAPs	23 tons/year
CO ₂ e	90,000 tons/year

NASA-Ames Research Center has successfully demonstrated that the facility wide potential to emit POC, PM10, SO₂ and HAPs are below the Title V emissions thresholds. However, the potential to emit NO_x, CO, and CO₂e is above Title V emissions thresholds and is subject to additional monitoring under the synthetic minor operating permit.

SMOP EVALUATION REPORT: NASA-AMES RESEARCH CENTER, PLANT #A0550,
Application 23438

2. NASA-Ames Research Center shall demonstrate compliance with the emission limits for NOx, CO, and CO2e as outlined below:
 - a. External Combustion Sources: All natural gas fired external combustion sources including all permitted and unpermitted boilers, heaters, and other external combustion devices. Unless otherwise approved by the BAAQMD, emission factors for NOx, CO, and CO2e shall be those submitted in Table B-1 of the SMOP application. Natural gas consumption applied to emission factors shall be actual metered throughput. Sources without a dedicated fuel meter shall be grouped together and linked to a main fuel meter in such a way as to determine the entire fuel use for the group. The highest applicable NOx, CO, and CO2e emissions factors for any source in the group shall be applied to the entire group.
 - b. Internal Combustion Sources: All internal combustion equipment (piston engines and turbines) fired by any fuel. Unless otherwise approved by the BAAQMD, emission factors for NOx, CO, and CO2e shall be those submitted in Table B-4 of the SMOP application. Fuel consumption shall be based on actual usage for each source in this category.
 - c. Miscellaneous Sources: All NOx sources that do not fit into any of the previous two categories. In general, these are research operations that produce NOx, without the combustion of a hydrocarbon fuel. Unless otherwise approved by the BAAQMD, emission factors for NOx shall be those submitted in Table B-9 of the SMOP application.

Emissions of NOx, CO, and CO2e from each source or source group shall be calculated and recorded on a monthly basis. Annual emissions shall be summarized on a rolling 12-month basis. All records required by the SMOP shall be kept on site and be available for inspection by BAAQMD personnel for at least 5 years from the date that a record was made. (Basis: Regulation 2-6-423)

3. NASA-Ames Research Center shall develop and maintain monitoring tables to clearly demonstrate compliance with the NOx, CO, and CO2e SMOP limits on a rolling 12-month basis beginning with the first calendar month after the issuance of the SMOP. All monitoring tables shall be updated as applicable when equipment is added to or removed from the facility. NASA-Ames Research Center has the authority under the SMOP to make additions and deletions to equipment in the approved monitoring tables without prior approval of the BAAQMD provided that approved emissions factors and monitoring methodologies are followed. The BAAQMD has the authority at any time to require modifications to the monitoring tables as deemed necessary to improve the accuracy or clarity of monitored data. (Basis: Regulation 2-6-423)

**SMOP EVALUATION REPORT: NASA-AMES RESEARCH CENTER, PLANT #A0550,
Application 23438**

RECOMMENDATION

The District is proposing to issue a Synthetic Minor Operating Permit to Site #A0550. In accordance with SIP Regulation 2-6-423.3, this preliminary decision is subject to a 30 day public comment period. At the conclusion of the comment period, the District will make a final decision on this matter after considering any comments received.

Notes:															
For the propane emergency generator, the manufacturer's emission data did not include the emission factors for PM and SO2. Since EPA's AP-42 emission factors don't include propane powered engines, the emission factors from EPA's AP-42 Section 3.2 Table 3.2-2 for natural gas engines were used.															
Hours Used For Calculations															
900 Hours for S1053 80 Hours for low-use engines (S1039, S1040, S1041 and S1054) 100 Hours for PTE Non-Emergency, PTE full (S1017, S1018, S1021, S1022, S1023, S1026 and S1042) 500 Hours for PTE Emergency N233, N254 & N258, super computers (S1029, S2540 and S2330) 2400 Permitted hours for prime UWT Generators (S2272 and S2273) 500 Hours for tub grinder (S22671) 100 Hours for PTE Emergency 100 Hours for PTE - Hydrosewer flusher (S1037) 500 Hours for PTE Emergency Water Pumps (S1032, S1033, S1046, S1047, S1048, S1051, S2210 and S2211)															
Assumptions for Calculations															
For the propane emergency generator, the manufacturer's emission data did not include the emission factors for PM and SO2. Since EPA's AP-42 emission factors don't include propane powered engines, the emission factors from EPA's AP-42 Section 3.2 Table 3.2-2 for natural gas engines were used.															
For engines which did not have emission factors from the BAAQMD's data (most of exempt engines), emission factors from EPA's AP-42 Section 3 were used. If the engines were diesel powered under <600 HP the emission factors from AP-42 Section 3.3 were used.															
Assumed higher heating value of 140,000 Btu/gal for Diesel (Distillate fuel value)
